Hiring Manager
SummitCart Technologies
Austin, TX

Dear Hiring Manager,

I'm applying for the Senior Frontend Software Engineer role at SummitCart Technologies. I have eight years of experience building customer-facing retail and commerce applications, with most of that work focused on React, Next.js, JavaScript, and the services that support them. In my current role, I own the frontend architecture for a multi-brand storefront and work closely with product, design, QA, merchandising, and operations teams to turn complex requirements into dependable customer experiences.

A recent example was a checkout issue involving inconsistent cart, promotion, and fulfillment state. I reworked the state transitions and GraphQL data loading so order summaries stayed aligned across the flow, while also giving product managers clearer criteria for evaluating releases. I have also built Node.js services and REST integrations for inventory and customer data, added validation and secure service boundaries, and investigated peak-season performance using application traces, PostgreSQL query plans, and MongoDB access patterns.

I care about the practices that make this work sustainable: reusable components, focused tests, readable pull requests, and technical decisions that others can understand. At Harborline Commerce, I helped establish Mocha and JUnit conventions and added contract coverage for third-party APIs. Earlier, I worked with Docker and Kubernetes, modeled PostgreSQL and MongoDB data flows, and supported both Scrum and Kanban teams. I would bring that combination of frontend depth, full-stack judgment, and straightforward collaboration to SummitCart's digital technology group.

I'd welcome the chance to discuss how I could contribute to SummitCart's customer-facing applications and engineering practices. Thank you for your consideration.

Sincerely,

Luka Berg
