Hiring Manager
Northstar Financial Systems
New York, NY

Dear Hiring Manager,

I am applying for the Vice President, Front-End Engineer position at Northstar Financial Systems. In my current role, I lead front-end and service-layer engineering for investment reporting applications used by five internal business groups. My work has centered on making financial data easier to use and more dependable: I helped shape .Net REST services that combine account, portfolio, client, and holdings data from several sources into consistent responses for Angular applications.

I also bring practical experience building the engineering practices that keep those applications maintainable. I established reusable HTML, CSS, and JavaScript components adopted by three product squads, and designed GitLab pipelines with unit-test gates, static checks, artifact promotion, and deployment approvals. I regularly review JavaScript, Angular, NodeJS, and .Net code for test coverage, privacy exposure, maintainability, and alignment with technology standards. At a previous employer, I also provisioned Kafka topics and application access through Python and Shell utilities for roughly 30 application consumers.

The part of this role that especially fits my background is the connection between technical decisions and business needs. I have translated requirements into flowcharts, layouts, integration notes, and implementation plans, then worked with business and technology teams to resolve data-quality, authorization, and release issues before they reached production. I would bring that same approach to Northstar: clear recommendations, disciplined delivery, and attention to both security and long-term platform health. I hold a Bachelor of Science in Computer Science and would welcome the opportunity to discuss how I could contribute to your financial applications.

Thank you for your consideration. I look forward to hearing from you.

Sincerely,

Emilio Nguyen
